

Disclaimer

The following report(s) provides findings from an FDA-initiated query using Sentinel. While Sentinel queries may be undertaken to assess potential medical product safety risks, they may also be initiated for various other reasons. Some examples include determining a rate or count of an identified health outcome of interest, examining medical product use, exploring the feasibility of future, more detailed analyses within Sentinel, and seeking to better understand Sentinel capabilities.

Data obtained through Sentinel are intended to complement other types of evidence such as preclinical studies, clinical trials, postmarket studies, and adverse event reports, all of which are used by FDA to inform regulatory decisions regarding medical product safety. The information contained in this report is provided as part of FDA's commitment to place knowledge acquired from Sentinel in the public domain as soon as possible. Any public health actions taken by FDA regarding products involved in Sentinel queries will continue to be communicated through

FDA wants to emphasize that the fact that FDA has initiated a query involving a medical product and is reporting findings related to that query does not mean that FDA is suggesting health care practitioners should change their prescribing practices for the medical product or that patients taking the medical product should stop using it. Patients who have questions about the use of an identified medical product should contact their health care

The following report contains a description of the request, request specifications, and results from the modular program run(s).

If you are using a web page screen reader and are unable to access this document, please contact the Sentinel Operations Center for assistance at info@sentinelsystem.org.

Overview for cder_mpl2r_wp014

Request ID: cder_mpl2r_wp014_nsdp_v01

<u>Request Description</u>: In this analysis we assessed the risk of cutaneous small-vessel vasculitis (CSVV) associated with the use of direct oral anticoagulant (DOAC) and warfarin among patients with atrial fibrillation aged 21 to 99 years in the Sentinel Distributed Database (SDD).

<u>Sentinel Routine Querying Module</u>: Cohort Identification and Descriptive Analysis (CIDA) and Propensity Score Analysis (PSA) tools, version 9.6.0. This is a Type 2 analysis using the PSA module in the Query Request Package (QRP) documentation.

<u>Data Source</u>: The study period spanned from October 19, 2010 to February 29, 2020. We distributed the analytic package to 16 Data Partners (DP) on September 15, 2020. Five of the six analytic comparisons present aggregated data with converged models from 14 DPs and one analytic comparison presents aggregated data with a converged model from 15 DPs. See Appendix A for a list of the latest dates of available data for each DP included in this report.

<u>Study Design</u>: This study used a retrospective new-user cohort design. We identified cohorts of new initiators of rivaroxaban, dabigatran, apixaban, and warfarin among health plan members with a history of atrial fibrillation between the ages of 21 and 99 years. We evaluated the occurrence of CSVV event outcome among these cohorts. We then conducted a PSA using 1:1 propensity score (PS) matching in the following six comparisons: 1) rivaroxaban vs. warfarin; 2) dabigatran vs. warfarin; 3) apixaban vs. warfarin; 4) rivaroxaban vs. dabigatran; 5) rivaroxaban vs. apixaban; and 6) dabigatran vs. apixaban.

Exposures: We defined oral exposures of interest as new use of rivaroxaban (2.5, 10, 15, or 20 mg), dabigatran (75, 110, or 150 mg), apixaban (2.5 or 5 mg), and warfarin (1, 2, 2.5, 3, 4, 5, 6, 7.5, or 10 mg). We retained only the first valid exposure episode per patient. See Appendix B for a list of generic and brand names of medical products used to define exposures.

<u>Cohort Eligibility Criteria</u>: We required patients between the ages of 21 and 99 years to be continuously enrolled in plans with medical and drug coverage for at least 183 days before the index dispensing, during which gaps in coverage of up to 45 days were allowed. New use of the exposures of interest was defined as no use of rivaroxaban, dabigatran, apixaban, edoxaban, or warfarin in the 183 days preceding the index dispensing. See Appendices C for a list of generic and brand names of medical products used to define incidence criteria.

<u>Inclusion Criteria</u>: We included patients in the cohort with evidence of atrial fibrillation in the 183 days prior to and including the index dispensing date. See Appendix D for a list of International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) and International Classification of Diseases, Tenth Revision, Clinical Modification (ICD-10-CM) diagnosis codes used to define inclusion criteria.

Exclusion Criteria: We excluded patients from the cohort with evidence of an institutional stay (IS) recorded on the index dispensing date or with evidence of any other study drug of interest dispensed on the index date. We also excluded patients with evidence in the 183 days prior to and including the index dispensing date of any of the following: A) CSVV diagnosis of hypersensitivity angiitis, vasculitis of the skin, or allergic purpura in the ambulatory visit (AV), other ambulatory visit (OA), or emergency department (ED) care setting or steroid treatment for CSVV; B) diagnosis of select autoimmune disorders, including rheumatoid arthritis, lupus, Crohn's disease, Sjogren's syndrome, dermatomyositis, polymyositis, and cryoglobulinemia or treatment for these autoimmune disorders; C) cancer or chemotherapy treatment; D) kidney transplant or dialysis; or E) potential alternative indications, including deep vein thrombosis, pulmonary embolism, or joint replacement surgery prophylaxis. See Appendix E for a list of ICD-9-CM, ICD-10-CM, International Classification of Diseases, Tenth Revision, Procedure Coding System (ICD-10-PCS), Healthcare Common Procedure Coding System (HCPCS), and Current Procedural Terminology, Fourth Edition (CPT-4) codes and Appendix F for a list of generic and brand names of medical products used to define exclusion criteria.

Follow-up: We determined follow-up time based on the length of the exposure episodes and censored upon prespecified criteria. We created exposure episodes using outpatient pharmacy dispensing data. We bridged together exposure episodes less than 3 days apart and added 3 days at the end of each exposure episode to create continuous treatment episodes. Overlapping days supply of consecutive dispensings were stockpiled up to 33% of the first dispensing's days supply. We censored all exposure episodes at the first occurrence of any of the following: A) initiation of any other DOAC or warfarin (for DOAC cohorts) or initiation of any DOAC (for warfarin cohorts); B) end of exposure episode; C) disenrollment; D) death; E) Data Partner end date; or F) event outcome.

Event Outcome: We defined the event outcome of CSVV as a diagnosis of hypersensitivity angiitis, vasculitis of the skin, or allergic purpura in the AV, OA, or ED care setting. Within 90 days of a qualifying CSVV diagnosis (including the date of diagnosis), we required an oral or topical dispensing of steroid treatment. See Appendix G for a list of ICD-9-CM and ICD-10-CM diagnosis codes and Appendix H for a list of generic and brand names of medical products 'used to define the event outcome.

cder_mpl2r_wp014 Page 1 of 235

Overview for cder_mpl2r_wp014

Baseline Characteristics: We evaluated the following demographics on the index dispensing date: age, sex, race, and calendar year. We evaluated the occurrence of baseline characteristics in the 183 days prior to and including the index dispensing date, including the following: Charlson/Elixhauser combined comorbidity score¹, health care utilization, drug utilization, autoimmune diseases, hematological blood disorders, viral infections, bacterial infections, anti-infectives, nonsteroidal anti-inflammatory drugs, psychoactive drugs, cardiovascular and diuretic drugs, beta-adrenergic receptor agonists, anticonvulsants, and individual subcategories for each category of interest. We also evaluated the dispensing dose strength (in mg) of each exposure of interest recorded on the index date. See Appendix I for a list of ICD-9-CM and ICD-10-CM diagnosis codes and Appendix J for a list of generic and brand names of medical products used to define baseline covariates.

<u>Propensity Score Estimation:</u> For each of the six comparisons, we fit a logistic regression model to estimate the PS based on potential confounders as covariates. We included the following covariates in the adjusted PS model: age (continuous variable), sex, autoimmune diseases, hematological blood disorders, viral infections, bacterial infections, anti-infectives, nonsteroidal anti-inflammatory drugs, psychoactive drugs, cardiovascular and diuretic drugs, beta-adrenergic receptor agonists, and anticonvulsants. The matching ratio for the PSA was 1:1 and the matching caliper was 0.05. Patients in the exposed and comparator cohorts were nearest neighbor matched without replacement, meaning that each comparator patient was matched one time, at most, to an exposed patient. For each comparison, we used case-centered logistic regression models to estimate the adjusted hazard ratio and 95% confidence intervals for the unmatched analyses and unconditional and conditional matched analyses.

See Appendices K and L for specifications of parameters to define cohort entry, PSA, and covariates. See Appendix M for a pictorial design diagram of the request.

<u>Limitations</u>: As with all observational studies, this evaluation was limited in its ability to control for all sources of potential bias. Algorithms used to define exposures, event outcomes, inclusion and exclusion criteria, and covariates are imperfect and may be misclassified. Therefore, data should be interpreted with this limitation in mind.

<u>Notes:</u> Please contact the Sentinel Operations Center (info@sentinelsystem.org) for questions and to provide comments/suggestions for future enhancements to this document. For more information on Sentinel's routine querying modules, please refer to the documentation (https://dev.sentinelsystem.org/projects/SENTINEL/repos/sentinel-routine-querying-tool-documentation/browse).

¹The Charlson/Elixhauser Combined Comorbidity Score is calculated based on comorbidities observed during a requester-defined window around the exposure episode start date. (Gagne JJ, Glynn RJ, Avorn J, Levin R, Schneeweiss S. A combined comorbidity score predicted mortality in elderly patients better than existing scores. J Clin Epidemiol. 2011;64(7):749-759)

Glossary of Terms for Analyses Using Cohort Identification and Descriptive Analysis (CIDA) Module*

Amount Supplied - number of units (pills, tablets, vials) dispensed. Net amount per NDC per dispensing.

Blackout Period - number of days at the beginning of a treatment episode that events are to be ignored. If an event occurs during the blackout period, the episode is excluded.

Care Setting - type of medical encounter or facility where the exposure, event, or condition code was recorded. Possible care settings include: Inpatient Hospital Stay (IP), Non-Acute Institutional Stay (IS), Emergency Department (ED), Ambulatory Visit (AV), and Other Ambulatory Visit (OA). For laboratory results, possible care settings include: Emergency Department (E), Home (H), Inpatient (I), Outpatient (O), or Unknown or Missing (U). The Care Setting, along with the Principal Diagnosis Indicator (PDX), forms the Care Setting/PDX parameter.

Ambulatory Visit (AV) - includes visits at outpatient clinics, same-day surgeries, urgent care visits, and other same-day ambulatory hospital encounters, but excludes emergency department encounters.

Emergency Department (ED) - includes ED encounters that become inpatient stays (in which case inpatient stays would be a separate encounter). Excludes urgent care visits.

Inpatient Hospital Stay (IP) - includes all inpatient stays, same-day hospital discharges, hospital transfers, and acute hospital care where the discharge is after the admission date.

Non-Acute Institutional Stay (IS) - includes hospice, skilled nursing facility (SNF), rehab center, nursing home, residential, overnight non-hospital dialysis and other non-hospital stays.

Other Ambulatory Visit (OA) - includes other non overnight AV encounters such as hospice visits, home health visits, skilled nursing facility visits, other non-hospital visits, as well as telemedicine, telephone and email consultations.

Charlson/Elixhauser Combined Comorbidity Score - calculated based on comorbidities observed during a requester-defined window around the exposure episode start date (e.g., in the 183 days prior to index).

Code Days - the minimum number of times the diagnosis must be found during the evaluation period in order to fulfill the algorithm to identify the corresponding patient characteristic.

Cohort Definition (drug/exposure) - indicates how the cohort will be defined: 01: Cohort includes only the first valid treatment episode during the query period; 02: Cohort includes all valid treatment episodes during the query period; 03: Cohort includes all valid treatment episodes during the query period until an event occurs.

Computed Start Marketing Date - represents the first observed dispensing date among all valid users within a GROUP (scenario) within each Data Partner site.

Days Supplied - number of days supplied for all dispensings in qualifying treatment episodes.

Eligible Members - number of members eligible for an incident treatment episode (defined by the drug/exposure and event washout periods) with drug and medical coverage during the query period.

Enrollment Gap - number of days allowed between two consecutive enrollment periods without breaking a "continuously enrolled" sequence.

Episodes - treatment episodes; length of episode is determined by days supplied in one dispensing or consecutive dispensings bridged by the episode gap.

Episode Gap - number of days allowed between two (or more) consecutive exposures (dispensings/procedures) to be considered the same treatment episode.

Event Deduplication - specifies how events are counted by the Modular Program (MP) algorithm: 0: Counts all occurrences of a health outcome of interest (HOI) during an exposure episode; 1: de-duplicates occurrences of the same HOI code and code type on the same day; 2: de-duplicates occurrences of the same HOI group on the same day (e.g., de-duplicates at the group level).

Exposure Episode Length - number of days after exposure initiation that is considered "exposed time."

Exposure Extension Period - number of days post treatment period in which the outcomes/events are counted for a treatment episode. Extensions are added after any episode gaps have been bridged.

Lookback Period - number of days wherein a member is required to have evidence of pre-existing condition (diagnosis/procedure/drug dispensing).

Maximum Episode Duration - truncates exposure episodes after a requester-specified number of exposed days. Applied after any gaps are bridged and extension days added to the length of the exposure episode.

Member-Years - sum of all days of enrollment with medical and drug coverage in the query period preceded by an exposure washout period all divided by 365.25.

Minimum Days Supplied - specifies a minimum number of days in length of the days supplied for the episode to be considered.

Minimum Episode Duration - specifies a minimum number of days in length of the episode for it to be considered. Applied after any gaps are bridged and extension days added to the length of the exposure episode.

Monitoring Period - used to define time periods of interest for both sequential analysis and simple cohort characterization requests.

cder_mpl2r_wp014 Page 5 of 235

Principal Diagnosis (PDX) - diagnosis or condition established to be chiefly responsible for admission of the patient to the hospital. 'P' = principal diagnosis, 'S' = secondary diagnosis, 'X' = unspecified diagnosis, '.' = blank. Along with the Care Setting values, forms the Caresetting/PDX parameter.

Query Period - period in which the modular program looks for exposures and outcomes of interest.

Switch Evaluation Step Value - value used to differentiate evaluation step. Each switch pattern can support up to 2 evaluation steps (0 = switch pattern evaluation start; 1 = first evaluation; 2 = second evaluation).

Switch Gap Inclusion Indicator - indicator for whether gaps in treatment episodes that are included in a switch episode will be counted as part of the switch episode duration.

Switch Pattern Cohort Inclusion Date - indicates which date to use for inclusion into the switch pattern cohort of interest as well as optionally as the index date of the treatment episode initiating the switch pattern. Valid options are the product approval date, product marketing date, other requester defined date, or computed start marketing date.

Switch Pattern Cohort Inclusion Strategy - indicates how the switch pattern cohort inclusion date will be used: 01: used only as a switch cohort entry date. First treatment episode dispensing date is used as index for computing time to first switch; 02: used as switch cohort entry date and as initial switch step index date for computing time to first switch.

Treatment Episode Truncation Indicator - indicates whether the exposure episode will be truncated at the occurrence of a requester-specified code.

Washout Period (drug/exposure) - number of days a user is required to have no evidence of prior exposure (drug dispensing/procedure) and continuous drug and medical coverage prior to an incident treatment episode.

Washout Period (event/outcome) - number of days a user is required to have no evidence of a prior event (procedure/diagnosis) and continuous drug and medical coverage prior to an incident treatment episode.

Years at Risk - number of days supplied plus any episode gaps and exposure extension periods all divided by 365.25.

cder_mpl2r_wp014 Page 6 of 235

^{*}all terms may not be used in this report

Glossary of Terms for Analyses Using Propensity Score Analysis (PSA) Module*

Covariate - requester defined binary variable to include in the propensity score estimation model (e.g., diabetes, heart failure, etc.) during requester-defined lookback period. Requester may also choose to add any of the following categorical, continuous, or count metrics to the

- 1. Age (continuous)
- 2. Sex
- 3. Time period (i.e., monitoring period for sequential analyses)
- 4. Year of exposure
- 5. Comorbidity score
- 6. Medical utilization number of inpatient stays
- 7. Medical utilization number of institutional stays
- 8. Medical utilization number of emergency department visits
- 9. Medical utilization number of outpatient visits
- 10. Health care utilization number of other ambulatory encounters (e.g., telemedicine, email consults)
- 11. Drug utilization number of dispensings
- 12. Drug utilization number of unique generics dispensed
- 13. Drug Utilization number of unique drug classes dispensed

Covariate Evaluation Window - specified number of days relative to index date to evaluate the occurrence of covariates of interest. Note: members are required to have continuous enrollment during the covariate evaluation window, regardless of the value included in the "Continuous Individual Level Data Return - program may return individual-level, de-identified datasets to the Sentinel Operations Center (SOC). While the datasets contain a single row per patient for each specified analysis, patient identifiers such as a patient ID are not included in the output. Individual-level datasets are returned to the SOC, aggregated, and used to calculate effect estimates via Cox (proportional hazards) regression. Mahalanobis Distance - provides a measure of balance across all variables while accounting for their correlation.

Matching Caliper - maximum allowed difference in propensity scores between treatment and control patients. Requester may select any caliper Matching Ratio - patients in exposed and comparator groups are nearest neighbor matched by a 1:1 or 1:n (up to 10) matching ratio.

Matched Conditional and Unconditional Analysis - in a conditional matched analysis, a Cox model, stratified by Data Partner site and matched set, is run on the matched population. This can be done for both the both 1:1 and 1:n matched cohorts. In an unconditional analysis, a Cox model, stratified by Data Partner site only, is run on the matched population. This can be done for the 1:1 matched cohort only.

Propensity Score Stratification - option to stratify propensity scores based on requester-defined percentiles in the unmatched population. In a stratified analysis, a Cox model, stratified by Data Partner site, is run on the stratified population. Note that all patients identified in exposure and PSM Tool - performs effect estimation by comparing exposure propensity-score matched parallel new user cohorts. Propensity score estimation and matching are conducted within each Sentinel Data Partner site via distributed programming code; data are returned to the SOC, aggregated, Risk-set Level Data Return - alternative to the patient-level data return approach. In this approach, the PSM tool will produce de-identified, risk-set level datasets instead of or in addition to individual-level output. Whereas each observation in the patient-level datasets represents one patient in the cohort, each observation in the risk set dataset represents one event. Risk sets are created at the Data Partner site, returned to the SOC, Subgroup Analysis - may be conducted using any requester-defined covariates. Subgroup analyses may be performed in the unmatched and the Zero Cell Correction - indicator for whether to screen variables with a zero correction added to each cell in the confounder/outcome 2x2 table. Recommended when the number of exposed outcomes is fewer than 150.

²Race data may not be completely populated at all Data Partners; therefore, data about race may be incomplete.

³The Charlson/Elixhauser Combined Comorbidity Score is calculated based on comorbidities observed during a requester-defined window around the exposure episode start date. (Gagne JJ, Glynn RJ, Avorn J, Levin R, Schneeweiss S. A combined comorbidity score predicted mortality in elderly patients better than existing scores. J Clin Epidemiol. 2011;64(7):749-759)

^{*****}Data are not presented in these cells due to a small sample size or to assure a small cell cannot be re-calculated through the cells presented.

²Race data may not be completely populated at all Data Partners; therefore, data about race may be incomplete.

³The Charlson/Elixhauser Combined Comorbidity Score is calculated based on comorbidities observed during a requester-defined window around the exposure episode start date. (Gagne JJ, Glynn RJ, Avorn J, Levin R, Schneeweiss S. A combined comorbidity score predicted mortality in elderly patients better than existing scores. J Clin Epidemiol. 2011;64(7):749-759)

^{*}Covariates followed by an asterisk (*) are included in the adjusted propensity score analysis (PSA); rows without an asterisk (*) are baseline characteristics only and are not included in the adjusted PSA.

^{*****}Data are not presented in these cells due to a small sample size or to assure a small cell cannot be re-calculated through the cells presented.

²Race data may not be completely populated at all Data Partners; therefore, data about race may be incomplete.

³The Charlson/Elixhauser Combined Comorbidity Score is calculated based on comorbidities observed during a requester-defined window around the exposure episode start date. (Gagne JJ, Glynn RJ, Avorn J, Levin R, Schneeweiss S. A combined comorbidity score predicted mortality in elderly patients better than existing scores. J Clin Epidemiol. 2011;64(7):749-759)

^{*****}Data are not presented in these cells due to a small sample size or to assure a small cell cannot be re-calculated through the cells presented.

²Race data may not be completely populated at all Data Partners; therefore, data about race may be incomplete.

³The Charlson/Elixhauser Combined Comorbidity Score is calculated based on comorbidities observed during a requester-defined window around the exposure episode start date. (Gagne JJ, Glynn RJ, Avorn J, Levin R, Schneeweiss S. A combined comorbidity score predicted mortality in elderly patients better than existing scores. J Clin Epidemiol. 2011;64(7):749-759)

^{*}Covariates followed by an asterisk (*) are included in the adjusted propensity score analysis (PSA); rows without an asterisk (*) are baseline characteristics only and are not included in the adjusted PSA.

^{*****}Data are not presented in these cells due to a small sample size or to assure a small cell cannot be re-calculated through the cells presented.

²Race data may not be completely populated at all Data Partners; therefore, data about race may be incomplete.

³The Charlson/Elixhauser Combined Comorbidity Score is calculated based on comorbidities observed during a requester-defined window around the exposure episode start date. (Gagne JJ, Glynn RJ, Avorn J, Levin R, Schneeweiss S. A combined comorbidity score predicted mortality in elderly patients better than existing scores. J Clin Epidemiol. 2011;64(7):749-759)

^{*****}Data are not presented in these cells due to a small sample size or to assure a small cell cannot be re-calculated through the cells presented.

²Race data may not be completely populated at all Data Partners; therefore, data about race may be incomplete.

³The Charlson/Elixhauser Combined Comorbidity Score is calculated based on comorbidities observed during a requester-defined window around the exposure episode start date. (Gagne JJ, Glynn RJ, Avorn J, Levin R, Schneeweiss S. A combined comorbidity score predicted mortality in elderly patients better than existing scores. J Clin Epidemiol. 2011;64(7):749-759)

^{*}Covariates followed by an asterisk (*) are included in the adjusted propensity score analysis (PSA); rows without an asterisk (*) are baseline characteristics only and are not included in the adjusted PSA.

^{*****}Data are not presented in these cells due to a small sample size or to assure a small cell cannot be re-calculated through the cells presented.

²Race data may not be completely populated at all Data Partners; therefore, data about race may be incomplete.

³The Charlson/Elixhauser Combined Comorbidity Score is calculated based on comorbidities observed during a requester-defined window around the exposure episode start date. (Gagne JJ, Glynn RJ, Avorn J, Levin R, Schneeweiss S. A combined comorbidity score predicted mortality in elderly patients better than existing scores. J Clin Epidemiol. 2011;64(7):749-759)

^{*****}Data are not presented in these cells due to a small sample size or to assure a small cell cannot be re-calculated through the cells presented.

²Race data may not be completely populated at all Data Partners; therefore, data about race may be incomplete.

³The Charlson/Elixhauser Combined Comorbidity Score is calculated based on comorbidities observed during a requester-defined window around the exposure episode start date. (Gagne JJ, Glynn RJ, Avorn J, Levin R, Schneeweiss S. A combined comorbidity score predicted mortality in elderly patients better than existing scores. J Clin Epidemiol. 2011;64(7):749-759)

^{*}Covariates followed by an asterisk (*) are included in the adjusted propensity score analysis (PSA); rows without an asterisk (*) are baseline characteristics only and are not included in the adjusted PSA.

^{*****}Data are not presented in these cells due to a small sample size or to assure a small cell cannot be re-calculated through the cells presented.

This report executed the Cohort Identification and Descriptive Analysis (CIDA) and Propensity Score Analysis (PSA) tools to assess the risk of cutaneous small-vessel vasculitis (CSVV) among patients with atrial fibrillation who are new users of warfarin or a direct oral anticoagulant (DOAC).

Query Period: October 19, 2010 - February 29, 2020

Coverage Requirement: Medical and drug coverage

Enrollment Requirement: 183 days **Enrollment Gap:** 45 days

Sex: Male and Female

Age Groups: 21-64, 65-74, 75-84, 85-99 years

		DOAC (Rivaroxaban, Dabigatran, Apixaban) vs. Warfarin
